1   Introduction

We are very pleased to announce the latest release of Votiro's Secure File Gateway, version 9.5. The focus on this version has been on scaling. We have achieved a stable 5-node environment with a throughput in excess of 100,000 files per hour.

We introduce a portal where users can enter passwords for password protected files, managed as part of the process for Positive Selection Engine. The portal is designed for minimal interruption, so users can continue working securely and without waiting for admin involvement for the release of their files.

In this release we have added to the suit of file families recognized for Positive Selection Engine.We have added four file types in the MacOS family.

As always, we fixed several bugs and carried out general product maintenance to provide a more stable environment with an ever-increasing throughput of files for processing.

2   New Features

The following new features and improvements are added to this version of Votiro's Secure File Gateway.

2.1   Password Protected File - Portal

This release introduces the Password Protected File (PPF) portal, a feature for end users to have direct control over managing their password protected files safely and securely.

The PDF and portal can both be customized, resulting in messages and images consistent with your organization's branding and style.

2.2   Introduction of a 5 Node Cluster
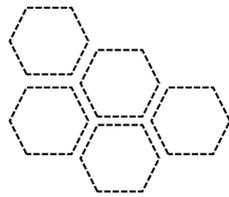

In this release we scaled from a standard 3-node cluster to a 5-node cluster. The throughput of files processed for Positive Selection Engine has significantly increased, with minimal additional overhead seen on each worker node.

2.3   Support for Mac File Formats

In this release we added four Mac OS file formats to our detection process, enabling Mac users to collaborate securely.

Prior to this inclusion we had blocked MAC OS files, which remains the default setting. With the recognition of these file types, users can create exception or added as an exception.

2.4   Increased Throughput to 100k Files per hour

As alluded to in our version 9.4 release notes, we have significantly scaled the throughput of files in version 9.5, when using a cluster configuration of 5 nodes.

We are consistently seeing in excess of 100k files per hour go through our Positive Selection Engine engine to deliver 100% safe files to your workforce.

And there's more...

We are looking forward to introducing the redesigned Secure File Gateway in just a few more weeks...

3   Deprecated Features

We are pleased to announce that no features have been deprecated in version 9.5.
